Breast carcinoma - assisted pathology report

Case **DEMO-B1** | specimen: **core biopsy** | 2026-10-03 15:53

Histological grade (Nottingham / Elston-Ellis)

Component	Assistant	Final score	Source	Measurement
Tubule formation	3	3	assistant (accepted) *	tubules 0% of 2.9 mm² invasive tumour
Nuclear pleomorphism	3	3	assistant (accepted) *	P(1/2/3) = [0.0, 0.087, 0.913], 3 fields, 3398 tumour nuclei
Mitotic count	3	3	assistant (accepted) *	26 mitoses in 10 HPF (field diameter 0.339 mm)
Total / grade		9		**Grade 3**

* automatic method not yet validated against local pathologists.

Core biopsy: Grade assessed on a core biopsy may differ from the grade of the excision specimen (in particular the mitotic count may be under-estimated in limited material); the grade should be confirmed on the excision specimen.

Biomarkers

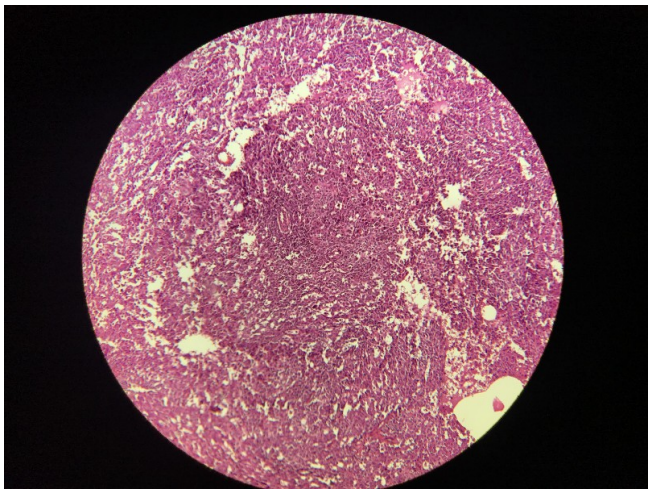

Marker	Result	Details	Method
ER	not assessed		
PR	not assessed		
HER2	**3+**	HER2-positive; any staining 85.12%, complete 30.4%, strong 13.42%; 954 cells	membrane ring, ASCO/CAP rules *
Ki-67	**24.64%**	global 24.64% (206/836); hotspot 36.06%; Intermediate (6-29%)	DAB positivity, global + hotspot *

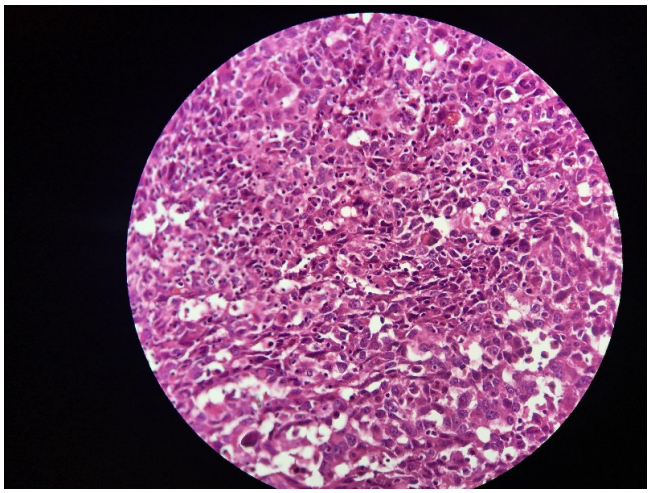

* thresholds / model not yet validated on local cases.

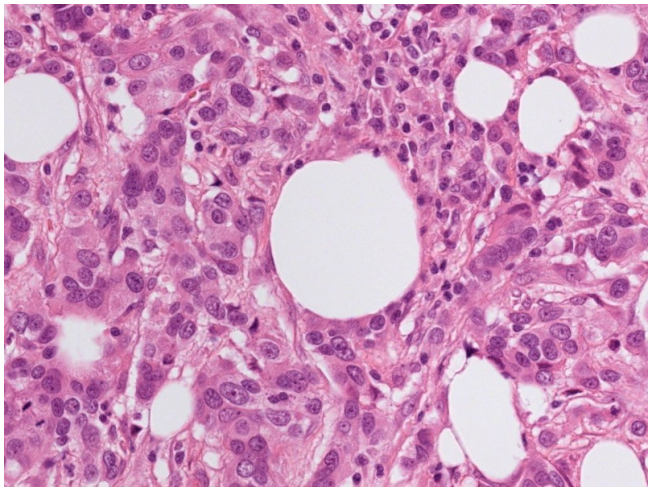

Notes from the assistant

- HER2: Field 2: High background DAB (0.32 OD outside cells): possible non-specific staining.
- Ki67: Cell-type filter off: all detected nuclei were counted, not only tumour nuclei.
- Ki67: Hotspot pooled over 4 fields to reach 500 nuclei; make sure they are adjacent fields from the same hotspot.
